

BS Smart Solution

Frontend Developer Handoff · B2B Lead Generation Platform · July 2026

What this website is: a B2B showcase site — *not e-commerce*. Customers browse **Products** (bulk supplies), **Services** (local & business services) and **Social Services** (donations/volunteering). They cannot buy online. The only conversion action is: fill an enquiry form → the enquiry is saved via the API → the browser redirects to **WhatsApp** with a pre-filled message.

1. Tech & Setup

Item	Detail
Framework	React 18 + Vite, react-router-dom v6 (a working reference build already exists in <code>frontend/</code>)
API base	<code>/api/v1</code> — proxied to <code>http://localhost:5000</code> in dev (see <code>vite.config.js</code>)
Auth (admin only)	JWT Bearer tokens in <code>localStorage</code> ; refresh flow already implemented in <code>src/api/client.js</code>
Images	Served from <code>/uploads/<file></code> ; every product/service may have <code>image: null</code> → show a placeholder
Response shape	<code>{ success, message, data, meta? }</code> ; errors: <code>{ success:false, message, errors?[] }</code>

2. Colour Theme (minimal, flat)

All colours are CSS variables in `src/index.css` . Flat design: 1px borders, 6px radius, no shadows, **no animations**, system font stack.

Token	Value	Usage
 <code>--bg</code>	<code>#f7f8fa</code>	Page background
 <code>--surface</code>	<code>#ffffff</code>	Cards, tables, panels, forms
 <code>--border</code>	<code>#e3e6ea</code>	All borders
 <code>--text</code>	<code>#1c2430</code>	Primary text
 <code>--text-dim</code>	<code>#5b6572</code>	Secondary text
 <code>--primary</code>	<code>#0f6fde</code>	Buttons, links, active states
 <code>--primary-d</code>	<code>#0b57ad</code>	Hover state
 <code>--success</code>	<code>#1e8e5a</code>	WhatsApp / donate buttons, success text
 <code>--danger</code>	<code>#c93b3b</code>	Delete buttons, error text

3. Page Inventory — 14 pages total (7 public + 7 admin)

Public pages (7)

#	Route	Page	Design / behaviour
1	/	Landing	Hero title + tagline, then 3 large option cards : Product, Service, Social Service (no icons/emoji). Below: featured products & featured services rows.
2	/products	Products	Two-step browser . Step 1: 11 large option cards — “All Products” + 10 categories (name + one-line tagline). Step 2: card grid of that category’s products (image, name, category, short description, price range, MOQ), search box, “← All Categories” back button. No pagination — full list loads (limit 100). Category kept in URL: <code>?category=slug</code> .
3	/products/:slug	Product detail	Panel: name, category, image, description, specifications table (key/value JSON), price range + min. order, gallery thumbnails, green “ Enquire on WhatsApp ” button → <code>/enquiry?type=PRODUCT&productId=...</code>
4	/services	Services	Same two-step browser: 17 option cards (“All Services” + 16 categories) → service cards (image/placeholder, name, category, short description, price label: Fixed / “From ₹X” / “Price on inspection”).
5	/services/:slug	Service detail	Panel: name, image, description, price line, coverage area, gallery, enquiry button. If the service is <i>social</i> (<code>category.kind === "SOCIAL"</code>): hide price, show “Free community initiative”, button text “Join / Donate on WhatsApp”.
6	/social-service	Social Service	Two-step browser: 11 option cards (“All Initiatives” + 10 causes) → initiative cards with green “ Join / Donate ” button (no prices anywhere).
7	/enquiry	Enquiry form	Reads query params (<code>type</code> , <code>productId</code> / <code>serviceId</code> , <code>name</code>). Fields: name*, phone*, email, quantity (products only), message. Submit → <code>POST /leads</code> → redirect browser to returned <code>whatsappUrl</code> . Show field-level validation errors in red.

Admin pages (7) — behind login, plain data-management UI

#	Route	Page	Design / behaviour
8	/admin/login	Login	Centered panel, email + password, generic error message.
9	/admin	Dashboard	Stat tiles (total/today/week/month leads, active products & services), leads-by-status badges, recent-leads table, nav buttons to all admin pages.
10	/admin/leads	Leads	Table with filters (search name/phone, status, enquiry type) + pagination. Status is an inline dropdown per row (NEW / CONTACTED / IN_PROGRESS / CONVERTED / CLOSED).
11	/admin/products	Manage products	Create/edit form (name, category select, descriptions, MOQ, price range, unit, featured, image upload) + table with Edit / Enable–Disable / Delete.
12	/admin/services	Manage services	Same pattern; category select covers business + social categories; price type select (FIXED / STARTING_FROM / ON_INSPECTION).
13	/admin/categories	Manage categories	Simple form + table (product categories); delete blocked with error if products exist.
14	/admin/settings	Settings	Key/value editor — includes <code>whatsapp_number</code> , business name/address/email.

4. Data / Catalogue Sizes (already seeded via API)

- **Products:** 10 categories, 55 products (e.g. Packaging Materials ×7, Safety ×6, Electrical ×6...)
- **Services:** 16 categories, 93 services (Construction & Interior ×11, IT & Digital ×10...)
- **Social Services:** 10 causes, 42 initiatives (Food, Clothing, Education, Digital Donation...)
- Most items currently have `image: null` → design a good placeholder state.

5. Key API Endpoints (public)

Endpoint	Returns
GET /api/v1/categories	10 product categories (name, slug, description, product count)
GET /api/v1/products?category=<slug>&search=&limit=100	Product cards; also <code>featured=true</code> for landing
GET /api/v1/products/:slug	Full product + category + gallery
GET /api/v1/services/categories/all + ?kind=social	16 service categories / 10 social causes
GET /api/v1/services?category=<slug> + kind=social	Service / initiative cards
GET /api/v1/services/:slug	Full service (check <code>category.kind</code> for SOCIAL)
POST /api/v1/leads	Body: name, phone, enquiryType (PRODUCT/SERVICE/GENERAL), productId/serviceId, quantity?, message?, email? → returns <code>{ lead, whatsappUrl }</code> — redirect to <code>whatsappUrl</code>
GET /api/v1/settings/public	Business name, WhatsApp number, address

6. Rules & Constraints

- **WhatsApp flow is sacred:** always `POST /leads` first, then redirect to the `whatsappUrl` returned by the API. Never build the wa.me link on the frontend.
- Phone validation (API-enforced): Indian mobile `[6-9]XXXXXXXX` or international E.164.
- Keep the minimal flat theme: no animations, no shadows, no gradients, no emoji/icons on the main option cards.
- Responsive: option grids use `repeat(auto-fit/fit, minmax(240px, 1fr))` ; must work down to 360px width.
- Admin pages are functional tools — keep them plain tables + forms.
- Image uploads: JPG/PNG/WEBP, max 2 MB (enforced server-side; mirror the hint in the UI).

7. Reference

- Repository: <https://github.com/MS-Arui-19/BS-smart-solution>
- Working reference frontend: `frontend/` folder (all 14 pages implemented and API-tested)
- Full docs: `docs/01...07` — architecture, database, API spec, security, phases, frontend, deployment
- Run locally: `scripts\db-start.ps1` → `backend: npm run dev` → `frontend: npm run dev` → `http://localhost:5173`
